Coccinelle for Rust

Wednesday 18 September 2024 10:00 (30 minutes)

Coccinelle is a tool for program matching and transformation, relying on semantic patches, which describe code changes in terms of fragments of source code. Coccinelle for C has been extensively used on the Linux kernel. For the past couple of years we have been developing Coccinelle for Rust. This talk will highlight the main progress that has been made in the past year, with respect to control flow (…), disjunctions, and macros.
